

Ford Celebrates 20th Anniversary of Uni-Flange[®]

The Uni-Flange[®] Corporation began manufacturing adapter flanges and joint restraints in 1982. In the summer of 1994, Uni-Flange[®] was purchased by The Ford Meter Box Company, and a short time later, the product line was moved from Jacksonville, Florida to our facility in Pell City, Alabama, where production has continued ever since.

This year, Ford celebrates its 20th anniversary of producing and selling the Uni-Flange[®] product line. Providing a fast and economical method of restraining fittings, valves, and hydrants used on water main systems, our restraint products offer guaranteed joint restraint in every soil condition, every time.

By using Uni-Flange[®] mechanical restraints, concrete thrust blocks become a thing of the past. Unlike concrete, restraints can:

- be installed above ground and lowered into place
- be installed with less ground excavation
- restrain pipe immediately without waiting on concrete to cure
- be tested and backfilled immediately
- allow for disassembly and reassembly
- be used in above-ground applications

Strong sales for 20 years have provided millions of secure installations. As we celebrate this anniversary, we continue to expand the Uni-Flange[®] product line with new types and sizes to meet the needs of our customers. For more information about our flanges and joint restraints, please contact your local Ford distributor, The Ford Meter Box Company, or visit us online at www.fordmeterbox.com.
