Expanding Solutions for Easy Connections

Ford® Dismantling Joints have long provided a dependable option for pipeline installations that may require future service. Designed to expand and contract longitudinally, each joint provides the space needed to remove or replace nearby parts. This built-in flexibility makes it possible to perform maintenance without cutting pipe or disturbing the surrounding system. In addition to streamlining installation, it allows crews to respond faster to repair needs while avoiding costly disruptions.

Recently, Ford expanded its dismantling joint product line to include larger sizes, with many material and configuration choices available. With the recent acquisition of Baker Coupling, we now offer standard dismantling joints up to 120" (contact the factory for larger sizes) with various hardware and coating options. In addition to larger sizes, Ford now offers a comprehensive line of stainless-steel dismantling joints. Available in Type 304 or Type 316, our stainless line performs better in corrosive environments than traditional steel or ductile iron versions.

A newly developed brochure features our expanded dismantling joint offerings. The brochure showcases the full FDJ product line and reinforces the company's commitment to supporting a broad range of customers with durable, practical products tailored to their needs.
