

Addressing Pipe Misalignment

Introduced to easily connect or replace flanged fittings, the Ford® Equipment Connection Fitting (FECF) was designed with adaptability in mind.

The FECF is used to connect two flanges, allowing for horizontal (lateral) and vertical offset, or angular misalignment between flanged products. Additionally, the FECF has the similar longitudinal adjustment found in dismantling joints.

The FECF also features axial rods with spherical alignment washers on the flange lugs to keep rods straight and properly loaded, and to provide pipe restraint between flanged connections.

Available in a variety of sizes and styles, the FECF is an asset in the field. It is also designed for industrial and plant applications, maintaining a water tight and secure seal.

The Ford Equipment Connection Fitting is available with many custom hardware and coating options. For more information contact us at treatmentplantinfo@fordmeterbox.com.
