

The Same, *But* Different

Ford Meter Box now offers a simplified iron saddle line that uses one industry-standard coating. All ductile iron saddle bodies will now be coated with a black fusion bonded epoxy. This change will generate three changes to the line.

1. The F saddle will no longer be coated with e-coat, but will now be coated with fusion bonded epoxy.

2. The FC saddle that has always had a fusion bonded epoxy coating will be transitioning in color only, from seafoam green to black.

3. Since both the F and FC saddles will have the same coating, the FS line of iron saddles will be retired.

With this change to our epoxy coating, we will also be migrating many other products from seafoam green to black epoxy. This will allow for a consistent epoxy coating across all product lines.
